

Virag Shah

Microsoft Research - Inria Joint Centre
Palaiseau, France
virag.shah@inria.fr,
<https://virags.github.io/>

Research Interests

- System optimization and algorithm design for scalable cloud computing systems
- Applied queueing theory
- Developing an agile learning paradigm suitable for dynamic machine-human interactions

Education

Ph.D. in Electrical and Computer Engineering The University of Texas at Austin, USA	2015
Master of Engineering in Telecommunications Indian Institute of Science (IISc), Bangalore, India	2009
Bachelor of Engineering in Electronics Sardar Patel College of Engineering, Mumbai, India	2007

Awards

- **Best Paper Award** at *IEEE INFOCOM*, 2014 at Toronto, Canada. One of two papers selected (tied) from the 1650 papers submitted, and 313 papers accepted to the conference.
- **MCD Fellowship** at The University of Texas at Austin, 2010-11. Awarded to about top 1% applicants by the graduate school.
- **Best Paper Award** at *National Conf. on Comm. (NCC)*, 2010 at IIT Madras, India in communications track. 250 papers submitted, and 105 accepted to conference with 48 in communications track.

Research Experience

Microsoft Research-Inria Joint Centre <i>Agile machine learning for human-centric applications</i> <i>Postdoctoral Researcher</i> Hosts: Drs. Laurent Massoulié, Marc Lelarge, and Milan Vojnović	2016 - present
<ul style="list-style-type: none">• Ongoing work towards exploring alternate paradigms for machine learning for applications which interact dynamically with human consumers, eg., online Q&A platforms, crowdsourcing, hiring platforms, etc.	

- The objective is to design an automated framework which efficiently learns (and ‘unlearns’) the evolving patterns.

The University of Texas at Austin

Fall 2015

Leveraging coding and data dissemination in cloud clusters

Simons Postdoctoral Fellow

Host: Prof. François Baccelli

- We propose a recurrence equation as model for clusters which leverage coding and parallel server access to accelerate performance. It captures evolution of workload for systems of all dimensions and for all statistical assumptions.
- We provide new insights into mean latency under stochastic loads, e.g., we show that it increases logarithmically in file size for small files but linearly for large files.

The University of Texas at Austin

2010 - 2015

High performance and robustness in content delivery systems

MCD Fellow, Research Assistant

Advisor: Prof. Gustavo de Veciana

- We show that allowing servers to collaborate in servicing file download jobs offers substantial gains in download speeds while achieving robustness to load variations without requiring complex caching strategies.
- We provide a scalable performance model which enables disciplined engineering and study of performance-energy-reliability tradeoffs.
- With enough content diversity, we show that large systems exhibit a concentration property where several worst-case scenarios become unlikely, thus reducing the need for over-provisioning.

The University of Texas at Austin

2010 - present

Discovering files/objects in distributed P2P networks

MCD Fellow, Research Assistant

Advisor: Prof. Gustavo de Veciana

- We provide a new approach towards discovering files/objects which achieves stability under query resolution QoS constraints while accounting for various heterogeneity in file demands, altruism of super-peers, file placement, etc.

Alcatel-Lucent Bell Labs, New Jersey

2013

Location oblivious low latency data access in data centers

Summer Research Intern

Hosts: Dr. Murali Kodialam and Dr. T. V. Lakshman

- We provide a data storage architecture that guarantees a fixed low latency for data access, irrespective of the location of the request, by distributing data among the different memory locations such that network bottlenecks are avoided.
- We formulate the design of such systems as a linear program and developed a fast primal-dual algorithm which is faster than generic LP solvers.

Indian Institute of Technology, Bombay,

2009 - 2010

In-network function computation via network flows

Research Fellow

Advisors: Prof. D. Manjunath and Prof. Bikash K. Dey

- We develop fast algorithms for distributed function computations over networks with service constraints at nodes and capacity constraints at interconnecting links.
- Applications include throughput optimization in sensor networks and cloud computing systems.

Indian Institute of Science, Bangalore,

2007 - 2009

Distributed algorithms for wireless relay selection

Masters Research Project

Advisor: Prof. Neelesh B. Mehta

- We develop and optimize distributed algorithms for wireless cooperative relay selection and demonstrated an order of magnitude performance improvement over the state of the art in several scenarios.
- We optimize tradeoffs between resource allocation for selection and for data transmission, and demonstrated robustness of our algorithms.

Teaching Experience

Probability and Stochastic Processes

Fall 2013

Teaching Assistant, The University of Texas at Austin

Instructor: Prof. Gustavo de Veciana

Graduate Course Work

Engineering Courses

Analysis & Design of Comm. Networks,
Digital Communication, Wireless Networks,
Systems Theory, Detection and Estimation Theory,
Adv. Prob.: Learning, Inference and Networks.

Mathematical Courses

Stochastic Processes & Queuing Theory,
Convex Analysis and Optimization,
Theory of Probability, Matrix Theory,
Information Theory, Randomized Algorithms

Professional Services

Publicity Co-chair, ACM Mobihoc 2017
Reviewer for journals IEEE/ACM Trans. on Networking (ToN), Queueing Systems (QUESTA) and IEEE J. on Selected Areas in Comm. (JSAC), and for several conferences such as International Teletraffic Congress (ITC), IEEE International Symposium on Information Theory (ISIT), WiOpt, etc.
